

Business Requirements Document (BRD)

Project Title

Quick-Commerce Dark Store SLA & Inventory Variance Tracker

Business Problem

Quick-commerce companies promise deliveries within 10–15 minutes. However, delayed order dispatch, inventory mismatches, and stock-outs lead to SLA breaches, customer dissatisfaction, order cancellations, and revenue loss. Operations managers need a centralized analytics solution to monitor these issues and improve operational efficiency.

Business Objective

Build an analytics platform that monitors dispatch SLA, inventory variance, rider performance, and out-of-stock products to help operations teams make faster, data-driven decisions.

Stakeholders

- Operations Manager
- Dark Store Manager
- Inventory Manager
- Regional Operations Head
- Business Analyst

Success Metrics (KPIs)

- Dispatch SLA Breach Rate
- Average Dispatch Time
- Inventory Variance %
- Out-of-Stock SKU Count
- Lost GMV
- Rider Utilization
- Orders per Dark Store

Expected Outcome

Deliver an interactive dashboard that identifies operational bottlenecks, reduces SLA breaches, improves inventory accuracy, and supports faster decision-making.

Project Scope

In Scope

- Analyze order dispatch performance across dark stores.
- Monitor SLA breach percentage.
- Track inventory variance between system and physical stock.
- Identify high-frequency out-of-stock SKUs.
- Analyze rider performance and wait times.
- Build an interactive Power BI dashboard.
- Generate automated daily operational reports using Python.

Out of Scope

- Real-time GPS tracking.
- Payment gateway analysis.
- Customer support ticket analysis.
- Demand forecasting using Machine Learning.
- Live API integrations.
